Let *H* be an event with positive probability. Let *A* be any event. Then we define:

$$P(A|H) = rac{P(AH)}{P(A)}.$$

▲ロ▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Let *H* be an event with positive probability. Let *A* be any event. Then we define:

$$P(A|H) = \frac{P(AH)}{P(A)}.$$

From this:

$$P(AH) = P(A|H) \cdot P(A).$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Let *H* be an event with positive probability. Let *A* be any event. Then we define:

$$P(A|H) = \frac{P(AH)}{P(A)}.$$

From this:

$$P(AH) = P(A|H) \cdot P(A).$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Suppose H_1, \ldots, H_n are mutually exclusive events, and their union is the whole sample space Ω . That is, one of the H_i necessary occurs.

Let *H* be an event with positive probability. Let *A* be any event. Then we define:

$$P(A|H) = \frac{P(AH)}{P(A)}.$$

From this:

$$P(AH) = P(A|H) \cdot P(A).$$

Suppose H_1, \ldots, H_n are mutually exclusive events, and their union is the whole sample space Ω . That is, one of the H_i necessary occurs. Then we have for any event *A*:

$$A = AH_1 \cup AH_2 \cup \cdots \cup AH_n.$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Let *H* be an event with positive probability. Let *A* be any event. Then we define:

$$P(A|H) = \frac{P(AH)}{P(A)}.$$

From this:

$$P(AH) = P(A|H) \cdot P(A).$$

Suppose H_1, \ldots, H_n are mutually exclusive events, and their union is the whole sample space Ω . That is, one of the H_i necessary occurs. Then we have for any event *A*:

$$A = AH_1 \cup AH_2 \cup \cdots \cup AH_n.$$

Since the AH_i are mutually exclusive, their probabilities add:

$$P(A) = \sum_{j=1}^{n} P(A|H_j) \cdot P(H_j).$$

(ロ) (同) (三) (三) (三) (三) (○) (○)

For the special case of H_i we have:

$$P(H_j|A) = rac{P(AH_j)}{P(A)}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

For the special case of H_i we have:

$$P(H_j|A) = rac{P(AH_j)}{P(A)}.$$

Expanding $P(AH_i)$ and P(A), we get:

$$P(H_j|A) = \frac{P(A|H_j) \cdot P(H_j)}{\sum_{i=1}^n P(A|H_i) \cdot P(H_i)}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

For the special case of H_i we have:

$$P(H_j|A) = rac{P(AH_j)}{P(A)}.$$

Expanding $P(AH_j)$ and P(A), we get:

$$P(H_j|A) = \frac{P(A|H_j) \cdot P(H_j)}{\sum_{i=1}^n P(A|H_i) \cdot P(H_i)}.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

This is called *Bayes' Law*.

For the special case of H_i we have:

$$P(H_j|A) = rac{P(AH_j)}{P(A)}.$$

Expanding $P(AH_i)$ and P(A), we get:

$$P(H_j|A) = \frac{P(A|H_j) \cdot P(H_j)}{\sum_{i=1}^n P(A|H_i) \cdot P(H_i)}.$$

This is called *Bayes' Law*.

Bayes' law can be viewed as a learning algorithm: how probable is hypothesis H_j , given the data A that were observed using H_j ?

A Puzzle of Lewis Carroll

An urn contains a single marble, either white or black. Mr A puts another marble in the urn, a white one. The urn now contains two marbles. Next, Mrs B draws one of the two marbles from the urn. It turns out to be white. What is the probability that the other marble is also white? (Gardner [3])

Call the first white marble w and the second one w'. Mrs B does not know whether she is drawing from b + w' or from w + w'.

(日)

Call the first white marble w and the second one w'. Mrs B does not know whether she is drawing from b + w' or from w + w'.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

- For the drawing event there are four cases that are all equally likely:
 - 1. $b \wedge w'$: *b* is taken out,
 - 2. $b \wedge w'$: w' is taken out,
 - 3. $w \wedge w'$: w is taken out,
 - 4. $w \wedge w'$: w' is taken out.

- Call the first white marble w and the second one w'. Mrs B does not know whether she is drawing from b + w' or from w + w'.
- For the drawing event there are four cases that are all equally likely:
 - 1. $b \wedge w'$: *b* is taken out,
 - 2. $b \wedge w'$: w' is taken out,
 - 3. $w \wedge w'$: w is taken out,
 - 4. $w \wedge w'$: w' is taken out.
- Revealing the colour boils down to the public observation of ¬(b out).

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

- Call the first white marble w and the second one w'. Mrs B does not know whether she is drawing from b + w' or from w + w'.
- For the drawing event there are four cases that are all equally likely:

- A probabilistic model *M* is a tuple (*D*, *W*, *P*) with *D* a domain, *W* a set of worlds for that domain (predicate interpretations in that domain), and *P* a probability function over *W*, i.e., for all *w* ∈ *W*, *P*(*w*) ∈ [0, 1], and ∑_{*w*∈*W*} *P*(*w*) = 1.
- The probabilities in a model *M* represent the priors of an idealized semantic learner.

 An interpretation of L^m_n in an L^m_n-model M = (D, W, P) is given in terms of the standard notion w ⊨ φ, as follows:

$$\llbracket \phi \rrbracket^M := \sum \{ P(w) \mid w \in W, w \models \phi \}$$

(ロ) (同) (三) (三) (三) (三) (○) (○)

 An interpretation of L^m_n in an L^m_n-model M = (D, W, P) is given in terms of the standard notion w ⊨ φ, as follows:

$$\llbracket \phi \rrbracket^M := \sum \{ P(w) \mid w \in W, w \models \phi \}$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

It is straightforward to verify that this yields
 [[¬φ]]^M = 1 − [[φ]]^M.

 An interpretation of L^m_n in an L^m_n-model M = (D, W, P) is given in terms of the standard notion w ⊨ φ, as follows:

$$\llbracket \phi \rrbracket^M := \sum \{ P(w) \mid w \in W, w \models \phi \}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

- It is straightforward to verify that this yields
 [[¬φ]]^M = 1 − [[φ]]^M.
- Also, if $\phi \models \neg \psi$, i.e., if $W_{\phi} \cap W_{\psi} = \emptyset$, then $\llbracket \phi \lor \psi \rrbracket^{M} = \sum_{w \in W_{\phi \lor \psi}} P(w) =$ $\sum_{w \in W_{\phi}} P(w) + \sum_{w \in W_{\psi}} P(w) = \llbracket \phi \rrbracket^{M} + \llbracket \psi \rrbracket^{M}.$

 An interpretation of L^m_n in an L^m_n-model M = (D, W, P) is given in terms of the standard notion w ⊨ φ, as follows:

$$\llbracket \phi \rrbracket^M := \sum \{ P(w) \mid w \in W, w \models \phi \}$$

- It is straightforward to verify that this yields
 [[¬φ]]^M = 1 − [[φ]]^M.
- Also, if $\phi \models \neg \psi$, i.e., if $W_{\phi} \cap W_{\psi} = \emptyset$, then $\llbracket \phi \lor \psi \rrbracket^{M} = \sum_{w \in W_{\phi \lor \psi}} P(w) =$ $\sum_{w \in W_{\phi}} P(w) + \sum_{w \in W_{\psi}} P(w) = \llbracket \phi \rrbracket^{M} + \llbracket \psi \rrbracket^{M}.$
- Tautologies have probability 1, contradictions probability 0.

(日) (日) (日) (日) (日) (日) (日)

Example 1

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●
• Assume there are just two predicates Q₁ and Q₂, and two objects *a*, *b*.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

- Assume there are just two predicates Q₁ and Q₂, and two objects *a*, *b*.
- Complete ignorance about how the predicates are applied is represented by a model with 16 worlds, because for each object x and each predicate Q there are two cases: Q applies to x or not.

(日) (日) (日) (日) (日) (日) (日)

- Assume there are just two predicates Q₁ and Q₂, and two objects *a*, *b*.
- Complete ignorance about how the predicates are applied is represented by a model with 16 worlds, because for each object x and each predicate Q there are two cases: Q applies to x or not.

(日) (日) (日) (日) (日) (日) (日)

 If the probability of each of the cases is completely unknown, each of these worlds has probability ¹/₁₆.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

Example 2

• Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.

(日) (日) (日) (日) (日) (日) (日)

• Suppose it is known that no object has Q₂.

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.
- Suppose it is known that no object has Q₂.
- Then $W = \{w_1, w_2\}$ with $w_1(Q_1) = \{a, b\}$, $w_2(Q_1) = \{a\}$, $w_1(Q_2) = \emptyset$, $w_2(Q_2) = \emptyset$,

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.
- Suppose it is known that no object has Q₂.
- Then $W = \{w_1, w_2\}$ with $w_1(Q_1) = \{a, b\}$, $w_2(Q_1) = \{a\}$, $w_1(Q_2) = \emptyset$, $w_2(Q_2) = \emptyset$,

(日) (日) (日) (日) (日) (日) (日)

• *P* is given by $P(w_1) = \frac{2}{3}$, $P(w_2) = \frac{1}{3}$.

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.
- Suppose it is known that no object has Q₂.
- Then $W = \{w_1, w_2\}$ with $w_1(Q_1) = \{a, b\}$, $w_2(Q_1) = \{a\}$, $w_1(Q_2) = \emptyset$, $w_2(Q_2) = \emptyset$,

(日) (日) (日) (日) (日) (日) (日)

- *P* is given by $P(w_1) = \frac{2}{3}$, $P(w_2) = \frac{1}{3}$.
- In this example $\neg Q_1(b)$ is true in w_2 and not in w_1 .

- Suppose again there are two objects *a*, *b* and two predicates *Q*₁, *Q*₂.
- Suppose it is known that a has Q₁, and the probability that b has Q₁ is taken to be ²/₃.
- Suppose it is known that no object has Q₂.
- Then $W = \{w_1, w_2\}$ with $w_1(Q_1) = \{a, b\}$, $w_2(Q_1) = \{a\}$, $w_1(Q_2) = \emptyset$, $w_2(Q_2) = \emptyset$,

(日) (日) (日) (日) (日) (日) (日)

- *P* is given by $P(w_1) = \frac{2}{3}$, $P(w_2) = \frac{1}{3}$.
- In this example $\neg Q_1(b)$ is true in w_2 and not in w_1 .
- Therefore $[\![\neg Q_1(b)]\!] = \frac{1}{3}.$

 Learning a new semantic concept Q_{n+1} is learning how (or: to what extent) predicate Q_{n+1} applies to the objects one knows about.

(日)

- Learning a new semantic concept Q_{n+1} is learning how (or: to what extent) predicate Q_{n+1} applies to the objects one knows about.
- The simplest way to model such a learning event is as a pair (*Q_{n+1}*, φ(*x*)) where φ(*x*) is an *L^m_n* predication.

(ロ) (同) (三) (三) (三) (三) (○) (○)

- Learning a new semantic concept *Q*_{*n*+1} is learning how (or: to what extent) predicate *Q*_{*n*+1} applies to the objects one knows about.
- The simplest way to model such a learning event is as a pair (*Q_{n+1}*, φ(*x*)) where φ(*x*) is an *L^m_n* predication.
- The effect of the learning event could then be modelled in a way that is very similar to the manner in which factual change is modelled in epistemic update logic.

(ロ) (同) (三) (三) (三) (三) (○) (○)

- Learning a new semantic concept *Q*_{*n*+1} is learning how (or: to what extent) predicate *Q*_{*n*+1} applies to the objects one knows about.
- The simplest way to model such a learning event is as a pair (*Q_{n+1}*, φ(*x*)) where φ(*x*) is an *L^m_n* predication.
- The effect of the learning event could then be modelled in a way that is very similar to the manner in which factual change is modelled in epistemic update logic.
- The result of updating a model *M* = (*D*, *W*, *P*) with concept learning event (*Q_{n+1}*, φ(*x*)) is the model that is like *M* except for the fact that the interpretation in each world of *Q_{n+1}* is given by

$$w(Q_{n+1}) := \{ a \mid a \in D_m, w \models \phi(a/x) \}.$$

- Learning a new semantic concept *Q*_{*n*+1} is learning how (or: to what extent) predicate *Q*_{*n*+1} applies to the objects one knows about.
- The simplest way to model such a learning event is as a pair (*Q_{n+1}*, φ(*x*)) where φ(*x*) is an *L^m_n* predication.
- The effect of the learning event could then be modelled in a way that is very similar to the manner in which factual change is modelled in epistemic update logic.
- The result of updating a model M = (D, W, P) with concept learning event $(Q_{n+1}, \phi(x))$ is the model that is like Mexcept for the fact that the interpretation in each world of Q_{n+1} is given by

$$w(Q_{n+1}) := \{ a \mid a \in D_m, w \models \phi(a/x) \}.$$

 Note that the probability function P of the model does not change.

• Let's return to example 1.

- Let's return to example 1.
- This is the model where there are two objects and two predicates, and nothing is known about the properties of the objects.
